

# Multiagent Systems: Intro to Game Theory

CS 486/686: Introduction to Artificial Intelligence

# Are you thinking of going to graduate school?

2nd, 3rd, and 4th year undergraduates are invited to a graduate information session.

You will get an overview of Graduate Studies, including a brief description from:

- Applied Mathematics
- Combinatorics & Optimization
- Computational Mathematics
- Computer Science
- Pure Mathematics
- Statistics & Actuarial Science

You will have the chance to speak with department representatives and ask questions.

Refreshments will be served.

Wednesday, November 8, 2017  
DC 1301 (The "fishbowl")  
4:30 - 6pm

# Introduction

---

- So far almost everything we have looked at has been in a single-agent setting
  - Today - **Multiagent Decision Making!**
- For participants to act optimally, they must account for how others are going to act
- We want to
  - Understand the ways in which agents **interact** and **behave**
  - **Design** systems so that agents behave the way we would like them to

**Hint for the final exam:** MAS is my main research area. I like MAS problems. I even enjoy marking MAS questions. Two of the TAs do MAS research. They also like marking MAS questions. There **will** be a MAS question on the exam.

# Self-Interest

---

- We will focus on *self-interested* MAS
- Self-interested does **not** necessarily mean
  - Agents want to harm others
  - Agents only care about things that benefit themselves
- Self-interested means
  - Agents have their own *description* of states of the world
  - Agents take *actions* based on these descriptions

# What is Game Theory?

---

- The study of **games**!
  - Bluffing in poker
  - What move to make in chess
  - How to play Rock-Paper-Scissors

But also

- auction design
- strategic deterrence
- election laws
- coaching decisions
- routing protocols
- ...

# What is Game Theory?

---

- Game theory is a formal way to analyze **interactions** among a **group** of **rational** agents that behave **strategically**
  - **Group:** Must have more than 1 decision maker
    - Otherwise, you have a decision problem, not a game

Solitaire is  
not a game!

# What is Game Theory?

---

- Game theory is a formal way to analyze **interactions** among a **group** of **rational** agents that behave **strategically**
  - **Interaction**: What one agent does directly affects at least one other
  - **Strategic**: Agents take into account that their actions influence the game
  - **Rational**: Agents chose their best actions

# Example

---

- Decision Problem
  - Everyone pays their own bill
- Game
  - Before the meal, everyone decides to split the bill evenly

# Strategic Game

## (Matrix Game, Normal Form Game)

---

- Set of **agents**:  $I = \{1, 2, \dots, N\}$
- Set of **actions**:  $A_i = \{a_i^1, \dots, a_i^m\}$
- Outcome of a game is defined by a **profile**  $a = (a_1, \dots, a_n)$
- Agents have **preferences** over outcomes
  - Utility functions  $u_i: A \rightarrow \mathbb{R}$

# Examples

		Agent 2	
		One	Two
Agent 1	One	2, -2	-3, 3
	Two	-3, 3	4, -4

**Zero-sum game.**

$$\sum_{i=1}^n u_i(o) = 0$$

$$I = \{1, 2\}$$

$$A_i = \{\text{One}, \text{Two}\}$$

$A_n$  outcome is (One, Two)

$$U_1((\text{One}, \text{Two})) = -3 \text{ and } U_2((\text{One}, \text{Two})) = 3$$

# Examples

---

BoS

	B	S
B	2,1	0,0
S	0,0	1,2

Coordination Game

Chicken

	T	C
T	-1,-1	10,0
C	0,10	5,5

Anti-Coordination Game

# Example: Prisoners' Dilemma

---

Confess

Don't Confess

Confess

Don't  
Confess

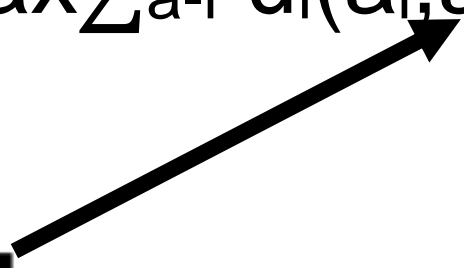

-5,-5	0,-10
-10,0	-1,-1

# Playing a Game

---

- Agents are **rational**
  - Let  $p_i$  be agent  $i$ 's belief about what its opponents will do
  - **Best response**:  $a_i = \operatorname{argmax}_{a_i} \sum_{a_{-i}} u_i(a_i, a_{-i}) p_i(a_{-i})$

Notation Break:  $a_{-i} = (a_1, \dots, a_{i-1}, a_{i+1}, \dots, a_n)$

# Dominated Strategies

---

- $a'_i$  **strictly dominates** strategy  $a_i$  if

$$u_i(a'_i, a_{-i}) > u_i(a_i, a_{-i}) \forall a_{-i}$$

- A rational agent will never play a dominated strategy!

# Example

---

	Confess	Don't Confess
Confess	-5,-5	0,-10
Don't Confess	-10,0	-1,-1

# Strict Dominance Does Not Capture the Whole Picture

---

	<i>A</i>	<i>B</i>	<i>C</i>
<i>A</i>	0,4	4,0	5,3
<i>B</i>	4,0	0,4	5,3
<i>C</i>	3,5	3,5	6,6

# Nash Equilibrium

---

**Key Insight:** an agent's best-response depends on the **actions of other agents**

An action profile  $a^*$  is a **Nash equilibrium** if no agent has incentive to change given that others do not change

$$\forall i u_i(a_i^*, a_{-i}^*) \geq u_i(a'_i, a_{-i}^*) \forall a'_i$$

# Nash Equilibrium

---

- Equivalently,  $a^*$  is a N.E. iff

$$\forall i a_i^* = \arg \max_{a_i} u_i(a_i, a_{-i}^*)$$

	A	B	C
A	0,4	4,0	5,3
B	4,0	0,4	5,3
C	3,5	3,5	6,6

(C,C) is a N.E. because

$$u_1(C, C) = \max \begin{bmatrix} u_1(A, C) \\ u_1(B, C) \\ u_1(C, C) \end{bmatrix}$$

**AND**

$$u_2(C, C) = \max \begin{bmatrix} u_2(C, A) \\ u_2(C, B) \\ u_2(C, C) \end{bmatrix}$$

# Nash Equilibrium

---

- If  $(a_1^*, a_2^*)$  is a N.E. then player 1 won't want to change its action given player 2 is playing  $a_2^*$
- If  $(a_1^*, a_2^*)$  is a N.E. then player 2 won't want to change its action given player 1 is playing  $a_1^*$

-5,-5	0,-10
-10,0	-1,-1

	A	B	C
A	0,4	4,0	5,3
B	4,0	0,4	5,3
C	3,5	3,5	6,6

# Another Example

---

	B	S
B	2,1	0,0
S	0,0	1,2

2 Nash Equilibria

Coordination Game

# Yet Another Example

---

		Agent 2	
		One	Two
Agent 1	One	2,-2	-3,3
	Two	-3,3	4,-4

# (Mixed) Nash Equilibria

---

- **(Mixed) Strategy:**  $s_i$  is a probability distribution over  $A_i$
- **Strategy profile:**  $s = (s_1, \dots, s_n)$
- **Expected utility:**  $u_i(s) = \sum_a \prod_j s(a_j) u_i(a)$
- **Nash equilibrium:**  $s^*$  is a (mixed) Nash equilibrium if

$$u_i(s_i^*, s_{-i}^*) \geq u_i(s_i', s_{-i}^*) \forall s_i'$$

# Yet Another Example

		q	
		One	Two
p	One	2,-2	-3,3
	Two	-3,3	4,-4

How do we determine p and q?

# Yet Another Example

---

		q	
		One	Two
p	One	2,-2	-3,3
	Two	-3,3	4,-4

How do we determine p and q?

# Exercise

---

	B	S
B	2,1	0,0
S	0,0	1,2

This game has 3 Nash Equilibrium (2 pure strategy NE and 1 mixed strategy NE).

# Mixed Nash Equilibrium

---

- Theorem (Nash 1950): Every game in which the action sets are finite, has a mixed strategy equilibrium.

John Nash  
Nobel Prize in Economics (1994)

# Finding NE

---

- Existence proof is *non-constructive*
- Finding equilibria?
  - 2 player zero-sum games can be represented as a **linear program** (polynomial)
  - For arbitrary games, the problem is in **PPAD**
  - Finding equilibria with certain properties is often **NP-hard**

# Repeated Games

---

Recall the Prisoner's Dilemma. What if the prisoners are **habitual** criminals?

-5,-5	0,-10	-5,-5	0,-10	-5,-5	0,-10
-10,0	-1,-1	-10,0	-1,-1	-10,0	-1,-1

- *How do we define payoffs?*
- *What is the strategy space?*

# Repeated Games

---

Recall the Prisoner's Dilemma. What if the prisoners are **habitual** criminals?

-5,-5	0,-10	-5,-5	0,-10	-5,-5	0,-10	...
-10,0	-1,-1	-10,0	-1,-1	-10,0	-1,-1	

How do we define payoffs?

- Average reward
- Discounted Awards
- ...

# Repeated Games

---

Recall the Prisoner's Dilemma. What if the prisoners are **habitual** criminals?

-5,-5	0,-10	-5,-5	0,-10	-5,-5	0,-10	...
-10,0	-1,-1	-10,0	-1,-1	-10,0	-1,-1	

Strategy space becomes significantly larger!

$S:H \rightarrow A$  where  $H$  is the **history** of play so far

Can now **reward** and **punish** past behaviour,  
worry about reputation, establish trust,...

# Repeated Games

---

Recall the Prisoner's Dilemma. What if the prisoners are **habitual** criminals?

-5,-5	0,-10	-5,-5	0,-10	-5,-5	0,-10	...
-10,0	-1,-1	-10,0	-1,-1	-10,0	-1,-1	

**Grim Strategy:** In first step cooperate. If opponent defects at some point, then defect forever

**Tit-for-Tat:** In first step cooperate. Copy what ever opponent did in previous stage.

# Extensive Form Games

---

- Normal form games assume agents are playing strategies simultaneously
  - What about when agents' take turns?
  - Checkers, chess,...

# Extensive Form Games (with perfect information)

---

- $G=(I,A,H,Z,\alpha,\rho,\sigma,u)$ 
  - $I$ : player set
  - $A$ : action space
  - $H$ : non-terminal choice nodes
  - $Z$ : terminal nodes
  - $\alpha$ : action function  $\alpha:H\rightarrow 2^A$
  - $\rho$ : player function  $\rho:H\rightarrow N$
  - $\sigma$ : successor function  $\sigma:H\times A\rightarrow H\cup Z$
  - $u=(u_1,\dots,u_n)$  where  $u_i$  is a utility function  $u_i:Z\rightarrow R$

# Extensive Form Games (with perfect information)

---

- The previous definition describes a **tree**

A strategy specifies an action to each non-terminal history at which the agent can move

$$S_1 = \{(A,G),(A,H),(B,G),(B,H)\}$$

$$S_2 = \{(C,E),(C,F),(D,E),(D,F)\}$$

# Nash Equilibria

---

We can transform an **extensive form** game into a **normal form** game.

	(C,E)	(C,F)	(D,E)	(D,F)
(A,G)	3,8	3,8	8,3	8,3
(A,H)	3,8	3,8	8,3	8,3
(B,G)	5,5	2,10	5,5	2, 10
(B,H)	5,5	1,0	5,5	1,0

# Subgame Perfect Equilibria

---

What are the NE?

# Subgame Perfect Equilibria

---

## Subgame Perfect Equilibria

$s^*$  must be a Nash equilibrium  
in **all subgames**

What are the SPE?

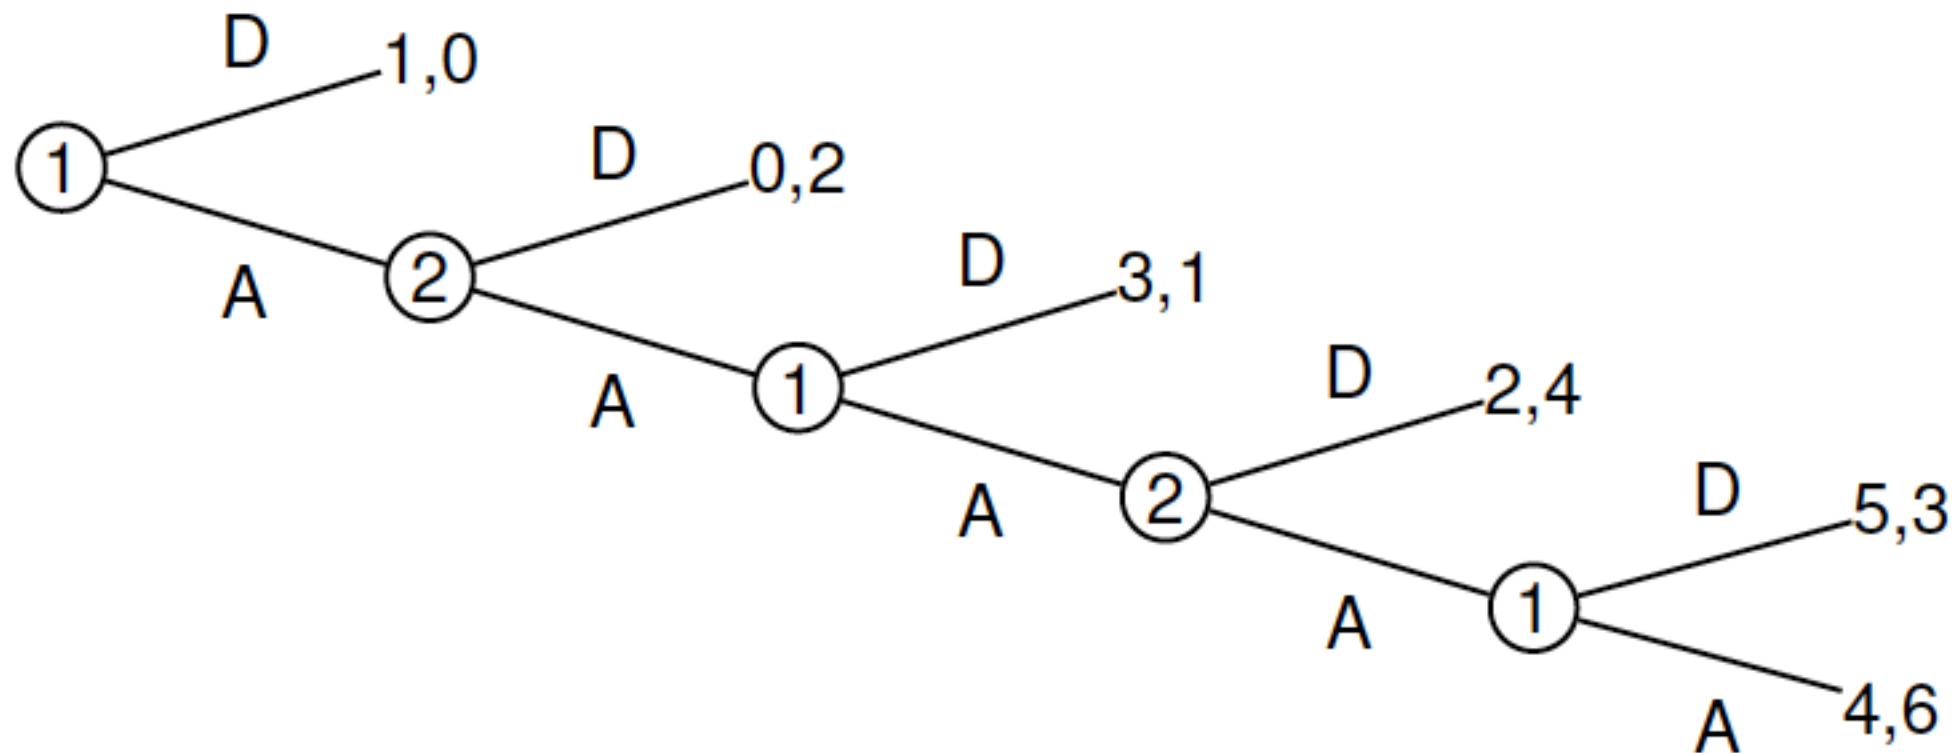

# Existence of SPE

---

- **Theorem (Kuhn):** Every finite extensive form game has an SPE.
- Compute the SPE using **backward induction**
  - Identify equilibria in the bottom most subtrees
  - Work upwards

# Example: Centipede Game

---

# Summary

---

- Definition of a Normal Form Game
- Dominant strategies
- Nash Equilibria
- Extensive Form Games with Perfect Information
- Subgame Perfect Equilibria
